

What is the difference between intramolecular and intermolecular?

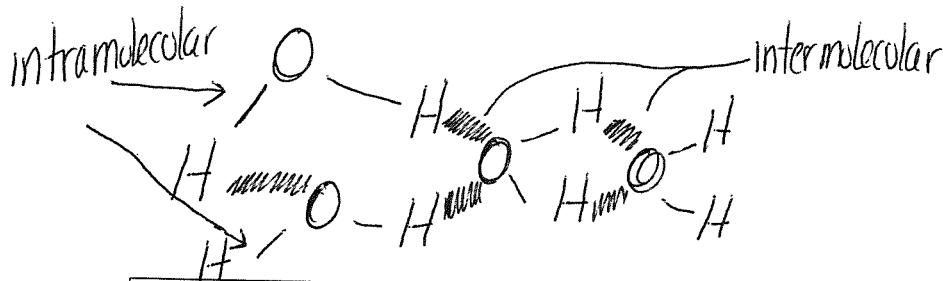

Which are stronger? within molecule.

Intramolecular

(covalent, ionic, metallic)

between molecules
(LDF, dipole-dipole, H-bond)

Draw 3 H_2O molecules Lewis structures and show where intramolecular and where intermolecular forces would be.

Phase Changes break

Intermolecular
 $\text{H}_2\text{O}(\text{s}) \rightarrow \text{H}_2\text{O}(\text{l})$

still H_2O just different phase

Energy to vaporize $\text{H}_2\text{O}(\text{l}) \rightarrow \text{H}_2\text{O}(\text{g}) = 40.6 \frac{\text{kJ}}{\text{mol}}$

Bond energy to break O-H bond $\rightarrow 934 \frac{\text{kJ}}{\text{mol}}$

Intramolecular Within	What is it? (give a definition)	Who does it? (what type of molecules or atoms)	Rank (within its type, so only 1, 2, or 3 - 1 being the strongest)	Example
Ionic	transfer of e^- electrostatic attraction between $(+)$ & $(-)$ ion	metals/nonmetals (cations) (anions)	2	NaCl CaCl_2
Covalent	sharing of e^- equally or unequally	2 nonmetals	1	CO , NO F_2
Metallic	bonding in metals "sea of electrons"	metal atoms	3	Ag , Cu , Al
Intermolecular between				
Dispersion LDF	attraction between temporary dipoles j^+ end of one molecule to j^- end next molecule	2 nonpolar molecules	3	$\text{H}_2 + \text{H}_2$ $\text{Cl}_2 + \text{Cl}_2$
Dipole-Dipole	attraction j^+ end of one molecule to j^- end of next molecule	2 polar molecules	2	$\text{CO} + \text{CO}$ $\text{HCl} + \text{HCl}$
Hydrogen bonding	especially strong dipole-dipole between $\text{H}-\text{F}$, $\text{H}-\text{O}$, or $\text{H}-\text{N}$ only	$\text{H}-\text{F}$ $\text{H}-\text{N}$ $\text{H}-\text{O}$	1	$\text{H}_2\text{O} + \text{H}_2\text{O}$ $\text{NH}_3 + \text{NH}_3$

NOTES

* Strength of force $\uparrow \text{BP}, \text{I}$

* If same force large has $\uparrow \text{BP}, \text{N}$

IN GENERAL: STRONGEST to WEAKEST

Covalent \geq Ionic $>$ Metallic $>$ H-bond $>$ dipole-dipole $>$ LDF
